Address: Beitun Dist., Taichung City 406, Taiwan

Summary

While working as an associate consultant in my previous company, I was introduced to SQL. That started my interest in coding. I've always been curious about software development, so I started off by learning my first programming language - R by going through an online course on data science. After that, I became interested in blockchain and learned Solidity. Due to the similarity between Solidity and JavaScript, and while also using the Hardhat framework which is also written in Javascript, I started studying Javascript. Later on, I also learned how to build the front end for smart contracts using the React framework and that was the first time I really found myself doing something I love!

Since being introduced to Javascript and React.js, I have read through as much material as I can. I've also taken some classes and on-line tutorials for JavaScript and React.js, and built a small project around it. After taking some time exploring my career interests, I truly have discovered my passion as a frontend developer.

Skills

- **Web Technologies:** HTML, CSS, JavaScript
- **Frameworks and Libraries:** React.js, Bootstrap, TailwindCSS,
- **Others:** Git, Python, SQL, R, Solidity
